

Yang-Jun Joo, Ph.D.

Quantitative Risk Assessment Data Scientist

Autonomous Vehicle Safety | Statistical Modeling | Large-Scale Driving Data

Orlando, FL (Open to relocation to Foster City, CA) | Email | Phone: +1 (407) 823-2841 | LinkedIn | GitHub | Google Scholar

Professional Summary: Quantitative risk assessment scientist with 8+ years of research and applied project experience developing probabilistic safety metrics, uncertainty-aware models, and automated analytics pipelines for autonomous-vehicle and transportation systems. Author of 15 published or accepted papers and PI on two competitively funded safety projects, with experience in Python, SQL, large-scale driving data, and human-behavior experiments.

TECHNICAL SKILLS

Programming & Data:	Python, SQL, R, pandas, NumPy, scikit-learn, PyTorch, Git, Linux, ETL and analytics pipelines, Apache Spark/PySpark.
Risk & Statistics:	Probabilistic modeling, Bayesian networks, reliability analysis, surrogate safety measures, regression, treatment-effect analysis, uncertainty quantification, conformal prediction.
Safety & Mobility:	Safety-performance metrics, AV safety evaluation, naturalistic driving video, connected-vehicle and trajectory data, traffic-conflict analysis, human factors.

PROFESSIONAL EXPERIENCE

Postdoctoral Scholar	University of Central Florida	Mar 2024 – Present
- Led FDOT quantitative safety workstreams with agency and technical partners, defining and validating safety metrics using high-resolution traffic-controller, connected-vehicle, and naturalistic driving data. - Built Python and SQL pipelines across 1,050 arterial links and four Florida freeways, automating data cleaning, metric generation, validation, and reporting. - Developed uncertainty-aware evaluation methods for autonomous-driving vision-language models using conformal prediction, identifying context-specific calibration failures in safety-critical driving-scene question answering.		
Postdoctoral Researcher	Seoul National University	Mar 2023 – Feb 2024
- Led a KRW 73.5M national fellowship as PI, examining human judgments of AV risk in near-miss and safety-critical scenarios. - Designed and analyzed a controlled study of 926 participants, 265 events, and 1,325 video clips; used regression and heterogeneous-treatment analysis to quantify effects of automation, severity, and participant characteristics on perceived risk.		
Graduate Research Assistant	Seoul National University	Mar 2018 – Feb 2023
- Developed probabilistic and reliability-based risk-assessment models for autonomous-vehicle lane changes, individual-driver crash risk, and proactive collision avoidance using Bayesian networks, surrogate safety measures, and risk-field methods. - Secured and led a KRW 96.1M Global Ph.D. Fellowship, producing three first-author peer-reviewed publications.
